The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducting a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic C T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is bound to an HLA molecule on the antigen-presenting cell, where when an A2 restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW29251.

ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                               Virucide, cytostatic, gene therapy, vaccine, epitope, cytotoxic T cell, MHC class I; CTL, HTL, A2-restricted cytotoxic lymphocyte, HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 49; DB 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a HTL epitope. The epitope is bound to an HLA molecule on the antigen-presenting cell, where when an A2 restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW32251-ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is composition of the mission of the composition of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADM29251-
ADM37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Virucide; cytostatic; gene therapy; vaccine; epitope; cytotoxic T cell; MHC class I; CTL; HTL; A2-restricted cytotoxic lymphocyte; HLA;
                                                                                                                                                                                                                                                                                                           New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a composition comprising at least one peptide chaving an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic reall response against a pre-selected antigen in a parient expressing a specific MiG class I allele by contacting cytotoxic composition comprises an epitope that is joined by an amino acid linker. The composition comprises an epitope that is joined by an amino acid linker. The composition comprises an epitope that is joined by an amino acid linker. The bound to an HLA molecule on the antigen-presenting cell, where when an A2 resprict cytotoxic lymphocyte (CTD) is present, a receptor of the CTD binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or captuages and ancer. The peptide epitopes are useful as diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADM29251-

MAN37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                              New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                   ö
                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of
                                               isolated nucleic acid detection reagent for detecting 1000 or more as from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid molecule, useful for diagnosing or treating prostate
                                                                                                                                                                                                                                                                   Gaps

assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ABPS1777-ABDS531 represent marker CDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but thouse, int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (1) a pharmaceutical composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New MHC class II compound, useful for preparing a composition for treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a new isolated lung specific nucleic acid molecule (I) comprising any of 113 fully defined nucleotide sequences given in the specification, their encoded protein sequences, sequences selectively hybridizing to the nucleotide sequences or a sequence having at least 60% identity to the nucleotide sequences. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the
comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune response in a subject; (5) a method of treating an immune disorder in a subject; (6) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and circuide, antibacterial, antiparasitic, cytostatic and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune disorders, e.g., viral infections, bacterial infections, parasitic infections, and can be used in appared by the MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated human lung specific nucleic acid molecule, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; gene therapy; vaccine; lung; diagnosis; cancer; non-cancerous lung disease; lung tissue; antagonist; gene therapy; transgenic animal; splice variant.

polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. Lung specific genes (LSGs) were identified by a systematic analysis of gene expression data in the LIFESEQ Gold database using the data mining software package candidate lead automatic search program (CLASP). Genes were grouped into gene bins where each bin is a cluster of sequences grouped together where they share a common contig.

Since a spressed tissue specific genes were selected based on the Differentially expressed tissue-specific genes were selected based on the expression levels for each gene in libraries of normal tissues or non-tumour tissues from cancer patients were compared with the expression levels in tissue associated with tumour or disease. This sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3611), expressed DNA sequences (ABL16176-ABL3611), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, heablides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of the cell cycle pathway.

C ignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one
                                                                                                                     ;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, aligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of supplement protein expression or biological activity. The involving aberrant protein expression or biological activity. The colypeptide and polymoraleotide sequences have applications in a polymoraleotide sequences not produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG3037, represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in

It is an example of copeptides of the invention that were designed to bind to the groove of human leukocyte antigen HLA-DR1 and HLA-DR4 molecules. The copeptides show a high affinity for major
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acids randomly joined in a linear array where one is aromatic, one is aliphatic and the other is charged, used to treat autoimmune diseases

                                                                                                                                                                                                                                                                               uveoretinitis, chronic immune thrombocytopenic purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxedema, myasthenia gravis, psoriasis, pemphigus vulgaris, rheumatoid arthritis and systemic lupus erythematosus (all claimed). The present peptide is a high level inhibitor of both HLA-DR-1 and -DR-4-restricted type II collagen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chronic immune thrombocytopenic purpura; collitis; contact sensitivity disease; diabetes mellitus; Graves disease; duolitus; Guillain-Barre's syndrome; Hashimoto's disease; idiopathic myxedema; myasthenia gravis; psoriasis; pemphigus vulgaris; rheumatoid arthritis; systemic lupus erythematosus; imunosuppressant; neuroprotective; systemic luthyroid, antidabetic; thyromimetic; antipsorialisis, antithhroid; antidabetic; dermatological; antidiflammatory; therapy; major histocompatibility complex; MHC class II; human lymphocyte antigen;
                                                                                 The present sequence represents a copeptide that can be used to treat autoimmune conditions. It is an example of copeptides of the invention that were designed to bind to the groove of human leukcoyte antigen HIA-DR1 and HIA-DR4 molecules. The copeptides show a high affinity for major histocompatability complex (MHC) class II proteins associated with an autoimmune disease, especially HIA-DR1, HIA-DR2 or HIA-DR4, bind to antigen presenting cells, and inhibit T cell responses. They are especially used to treat multiple sclerosis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune
aliphatic and the other is charged, used to treat autoimmune diseases.

The present sequence represents a copeptide that can be used to treat autoimmune conditions. It is an example of copeptides of the invention that were designed to bind to the groove of human leukocyte antigen HLA-DR1 and HLA-DR4 molecules. The copeptides show a high affinity for major histocompatability complex (MHC) class II proteins associated with an autoimmune disease, especially HLA-DR2, HLA-DR2 or HLA-DR2, The antigen presenting cells, and inhibit T cell responses. They are especially used to treat multiple sclerosis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroidatis, autoimmune especiality, disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto of disease, idiopathic myxedema, myasthenia gravis, psomphigus vulgaris, rheumatoid arthritis and systemic lupus erythematosus (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MHC class II; major histocompatibility complex; autoimmune disease; inflammatory disease; binding; rheumatoid arthritis; antiinflammatory; antiarthritic; multiple sclerosis.
                                                                                                                                                                                                                                                                     New terpolymers, copeptides and copolymer 1 which contain three amino acids randomly joined in a linear array where one is aromatic, one is aliphatic and the other is charged, used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New synthetic peptide, useful for treating autoimmune disease, e.g. rheumatoid arthritis.

The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids, positively charged amino acids, and alighbatic amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II protein associated with an autorimmune disease. The synthetic peptides have anticinflammatory and anti-arthritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid arthritis and multiple sclerosis. The peptides are specific for particular MHC class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random peptides; may include many repeats of the active sequence and/or contain amino acid analogues that improve stability (or other desired features). AAV82021 to AAV82044 represent specifically claimed epetide sequences which can be used as part of the synthetic peptides of the present invention; AAV82045 to AAV82061 represent specifically claimed examples of the synthetic peptides of the present invention; AAV82045
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                peptides from the present invention; and AAY82064 to AAY82080 represent other peptides used in the exemplification of the present invention

New synthetic peptide, useful for treating autoimmune disease, rheumatoid arthritis.

Claim 24; Page 41; 57pp; English.

The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids,

positively charged amino acids, and aliphatic amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II protein associated with an autoimmune disease. The synthetic peptides have anti-inflammatory and anti-arthritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid arthritis and multiple sclerosis. The peptides are specific for particular MHC class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random peptides; may include many repeats of the active sequence and/or contain amino acid analogues that improve stability (or other desired features). AAY82021 to AAY82044 represent specifically claimed peptide sequences which can be used as part of the synthetic peptides of the present invention; AAY82045 to AAY82063 represent present invention and AAY82060 represent present invention ö The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids, positively charged amino acids, and aliphatic amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II procein associated with an autoimmune disease. The synthetic peptides have anti-inflammatory and anti-arthritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid MHC class II; major histocompatibility complex; autoimmune disease; inflammatory disease; binding; rheumatoid arthritis; antiinflammatory; antiarthritic; multiple sclerosis. ö
treating neuronal degeneration caused by injury or disease comprising spinal cord injury, blunt trauma, penetrating trauma, haemorrhagic stroke, ischaemic stroke, diabetic neuropathy, senile dementia, Alzheimer's disease, Parkinson's disease, facial nerve (Bell's) palsy, glaucoma, Huntington's chorea, amyotrophic lateral sclerosis, status epilepticus, non-arteritic optical neuropathy, or vitamin deficiency. Cop lor the Cop 1-related peptide or polypeptide is useful in the preparation of a medicament for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration. AAG63175-AAG63206 represent peptides which bind to the peptide binding groove of HIA-DR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Promoting nerve regeneration or preventing, inhibiting or treating neuronal degeneration caused by injury or disease comprises administering T cells activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        epilepticus; non-arteritic optical neuropathy; vitamin deficiency;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a method for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration, or treating neuronal degeneration caused by injury or disease. The method comprises administering activated I cells which have been activated by copolymer 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neuronal degeneration; nerve regeneration; injury; disease; T cell; copolymer 1; Copolymer cord injury; blunt trauma; trauma; haemorrhagic stroke; ischaemic stroke; diabetic neuropathy; Bell's palsy senile dementia; Alzheimer's disease; Parkinson's disease; glaucoma; facial nerve palsy; Huntington's chorea; amyotrophic lateral sclerosis;
                                                                                                                                                                                   molecules. The peptides are homologous to the binding motifs of Cop 1, and have similar activities to Cop 1. As such, they may be used in the method of the invention
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide which binds to peptide binding groove of HLA-DR molecules.
                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kipnis J;
                                                                                                                                                                                                                                                                                                 Length 15;

Promoting nerve regeneration or preventing, inhibiting or treating neuronal degeneration caused by injury or disease comprises administering T cells activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or

New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating demyelinating disease, e.g. multiple sclerosis, or post-viral encephalomyelitis.

WPI; 2002-608439/65.

The present invention describes compositions (I) comprising a peptide

Example 1; Page 30; 54pp; English.

Disclosure; Page 32; 105pp; English

The specification describes a method for preventing or inhibiting

neuronal degeneration, or for promoting nerve regeneration, or treating neuronal degeneration caused by injury or disease. The method comprises administering activated T cells which have been activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or polypeptide; or Cop 1 or a Cop 1-related peptide or polypeptide; or Cop 1 or a Cop 1-related peptide or polypeptide; or Cop 1 or a Cop 1-related peptide. The method is used for preventing or confinibiting neuronal degeneration, or for promoting nerve regeneration, or treating neuronal degeneration caused by injury or disease comprising spinal cord injury, blunt trauma, penetrating trauma, haemorrhagic stroke, ischaemic stroke, diabetic neuropathy, senile dementa, captacke, diabetic neuropathy, senile dementa, captacke, diabetic neuropathy, or vitamin deficiency. Cop cylepticus, non-arteritic optical neuropathy, or vitamin deficiency. Cop 1 or the Cop 1-related peptide or polypeptide is useful in the cop 1-related peptide or polypeptide is useful in the cordinates which bind to the peptide binding groove of HLA-DR collections. The peptides which bind to the binding groove of HLA-DR cancer and have similar activities to Cop 1. As such, they may be used in the ö Human leukocyte antigen; HLA; major histocompatibility complex; MHC; HLA-DR2; MHC class II DR-2 molecule; demyelinating; multiple sclerosis; immune response; antiinflammatory; neuroprotective; proliferation; MHC class II protein inhibitor; demyelinating disease; inhibition; post-viral encephalomyelitis; post-vaccine demyelinating condition; Gaps ;; 0 Length 15; 0; Indels Score 47; DB 4; Pred. New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating a demyelinating disease, e.g. multiple sclerosis, or post-viral encephalomyelitis. 

Example 1; Page 30; 54pp; English.

with an amino acid sequence with typesite. It is the properties of the peptide with a major histocompatibility complex of the peptide with a major histocompatibility complex (MHC) class II History protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions comprising the peptides are useful for treating demyelinating diseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted T cell clones. ABP52207 to ABP52205 represent peptides used in the exemplification of the present present invention describes compositions (I) comprising a peptide invention

The present invention describes compositions (I) comprising a peptide with an amino acid sequence with tyrosine (Y), lysine (K), and/or valine residues. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions compositions the peptides are useful for treating demyelinating diseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an antitumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted T cell clones. ABPS5207 to ABPS5205 represent peptides used in the exemplification of the present

with an amino acid sequence with tyrosine (Y), lysine (K), and/or valine residues. The complex of the peptide with a major histocompatibility complex. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions comprising the peptides are useful for treating demyelinating diseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted I cell clones. ABP52207 to ABP52305 represent peptides used in the exemplification of the present

The invention relates to a vaccine that comprises an active agent from Copolymer I (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu, Tyr. The vaccine comprises the active agent without adjuvant or is emulsified in an adjuvant. The vaccine is useful for reducing disease progression and/or protection of motor nerve degeneration and/or protection of motor neuron disease e.g. protection from glutamate toxicity in motor neuron disease e.g. muscular atrophic lateral sclerosis, primary lateral sclerosis, progressive muscular atrophy, progressive bulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathogenic synthetic copolymers protects autoimmunity and thus reduces further injury-induced damage and protects central nervous system cells from glutamate toxicity; protects retinal cop-1 related-peptide.
                                                                                                                                                                                                                                                                    Vaccine useful in the treatment of motor neuron disease e.g. amyotrophic lateral sclerosis and progressive muscular atrophy, comprises copolymer-1 or related peptide or polypeptide, or poly-Glu, Tyr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cop-1; copolymer 1; vaccine; neuroprotective; glutamate toxicity; motor neuron disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; SEQ ID NO 29; 49pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a vaccine that comprises an active agent from Copolymer 1 (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu,Tyr. The vaccine comprises the active agent without adjuvant or is emulsified in an adjuvant. The vaccine is useful for reducing disease protection and/or protection of motor nerve degeneration and/or protection from glutamate toxicity in motor neuron disease e.g. amylotrophic lateral sclerosis, primary lateral sclerosis, progressive muscular atrophy, progressive bulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathogenic synthetic copolymers protects central nervous system calls from glutamate toxicity; protects retinal ganglion cells from glutamate toxicity. The present sequence represents a

The invention relates to a vaccine that comprises an active agent from Copolymer 1 (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu, Tyr. The vaccine comprises the active agent without adjuvant or is emulaified in an adjuvant. The vaccine is useful for reducing disease progression and/or protection of motor nerve degeneration and/or protection of motor nerve degeneration and/or protection of motor nerve degeneration and/or protection from glutamate toxicity in motor neuron disease e.g. amylotrophic lateral sclerosis, primary lateral sclerosis, progressive muscular atrophy, progressive bulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathogenic synthetic copolymers protects autoimmunity and thus reduces further injury-induced damage and protects central nervous system cells from glutamate toxicity; protects retinal ganglion cells from glutamate toxicity. The present sequence represents a Cop-1 related-peptide. Vaccine useful in the treatment of motor neuron disease e.g. amyotrophic lateral sclerosis and progressive muscular atrophy, comprises copolymer-1 or related peptide or polypeptide, or poly-Glu, Tyr. Disclosure; SEQ ID NO 23; 49pp; English.

Eye-drop vaccine for the therapeutic immunization of a mammal against glaucoma and neuronal degeneration caused by a disease in the central or

1-related polypeptide. (1) has ophthalmological, neuroprotective, notropic, antiparkinsonian, anticonvulsant, analgesic antidiabetic, hopatotropic, respiratory and osteopathic activities. The eye-drop vaccine (1) can be used for treating or preventing neuronal degeneration in the central caused by an injury, disease of sorter or condition in the central nervous system (CNS) or peripheral nervous system (PNS), for preventing or inhibiting neuronal secondary degeneration which may otherwise follow or in the PNS after an injury, disease, disorder or condition or for protecting CNS and PNS cells from glutamate toxicity, where the injury is spinal cord injury, blunt traum, penetrating traum, brain coup or contrecoup, haemorrhagic stroke or ischemic stroke, and where the disease is a semile demental including Parkinson's disease, and where the injury is spinal cord injury, blunt traum, contraction stroke, and where the disease is a semile demental including Parkinson's disease, and where the injury is spinal cord injury, bluntington's chorea, a motor neuron disease including aparkinson's disease, and where the injury is appropriate polary disease, aparten disease, and where the injury is anytopic lateral sclerosis, a prion disease, including parkinson's disease, and disease, and dependence, and autoimmune disease including disease, status epilepticus, carpal tunnel syndrome, indury carbot disease, anytome, antoimmune disease, acute such as amyloid polymeuropathy, hypedyscamia, sjocyen-lateson syndrome, acute sensory neuropathy, diabetic neuropathy, uremic neuropathy, chronic ataxic neuropathy, uremic neuropathy, chronic ataxic neuropathy, billary cirrhosis, primary auch as alcohol or organophosphates, charcet Marie-Tooth disease, actinal control and alcendance and derendance, and autoimmune disease control and alcohol or organophosphates, charcet Marie-Tooth disease, actinal derendance and alcendance and derendance and elemental recordance and control and alcohol or organophosphates, charcet Marie-Tooth disease, acti The present invention describes an eye-drop vaccine (I) for the therapeutic immunisation of a mammal. (I) comprises an active agent selected from Copolymer 1, a Copolymer 1-related peptide, and a Copolymer 1-related polypeptide. (I) has ophthalmological, neuroprotective, peripheral nervous system (e.g. Alzheimer's disease), comprises Copolymer such as retinal degeneration, or a disease associated with 1y elevated intraocular pressure such as glaucoma. The present represents a copolymer 1 related peptide, which is given in the exemplification of the present invention. Disclosure; SEQ ID NO 23; 49pp; English abnormally elevated disorder

peptide and a carrier

The present invention describes a pharmaceutical composition comprising an active agent selected from copolymer 1, a copolymer 1-related peptide and a carrier. Also described is an article of manufacture comprising packaging material and the pharmaceutical composition (preferably containing copolymer 1) contained within the packaging material. The packaging material includes a label that indicates that the agent is used for treating an inflammatory bowel disease. The pharmaceutical composition has antiinflammatory, antiulcer and gastrointestinal activities, and can be

Composition useful for the treatment of a patient suffering from an inflammatory bowel disease comprises an active agent selected from copolymer 1, a copolymer 1-related polypeptide, and a copolymer 1-related peptide and a carrier.

The present invention describes a pharmaceutical composition comprising an active agent selected from copolymer 1, a copolymer 1-related oblypeptide, and a copolymer 1-related peptide and a carrier. Also described is an article of manufacture comprising packaging material and the pharmaceutical composition (preferably containing copolymer 1) contained within the packaging material. The packaging material includes Example 2; SEQ ID NO 20; 55pp; English.

ö pharmaceutical composition; copolymer 1; copolymer 1-related polypeptide; copolymer 1-related peptide; inflammatory bowel disease; antiinflammatory; antiulcer; gastrointestinal; regulatory T cell inducer; Crohn's disease; ulcerative colitis. a label that indicates that the agent is used for treating an inflammatory bowel disease. The pharmaceutical composition has antiinflammatory, antiulder and gastrointestinal activities, and can be used as an inducer of regulatory T colls of the Th2 type. It can be used for the treatment of a patient suffering from an inflammatory bowel disease e.g. Crohn's disease and ulcerative colitis. The copolymer 1 binds promiscuously and with high affinity to various classes II MHC molecules of mouse and human origin, and can even displace antigens from the MHC antigen-binding groove. In this way, the presentation of other antigens and, consequently, the persistence of inflammatory process, are down regulated. In addition, Copolymer 1 is a potent inducer of regulatory T cells of the Th2 type. The present sequence represents a copolymer 1 related peptide which is used in the exemplification of the Gaps ö Score 47; DB 8; Length 15; Pred. This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one copolymer 1 or its related heteropolymer with at least one immunosuppressive drug. The present invention describes the copolymer as containing at least three different amino acids each selected from at least three of the following groups: lysine and arginine; glutamic acid and appartic acid; alamine, glycine and alamine; and tyrosine, tryptophan and phenylalanine. In addition, the immunosuppressive drug is an antiprofilerative drug, inhibitor of lymphocyte activation, steroid, purine antimetabolite, antibody or immunosuppressive activation, steroid, purine antimetabolite, antibody or immunoadulator. Accordingly, these immunosuppressive compositions can be used for treating or preventing or graft rejection associated with transplantation of cells, tissue or organs (HiA-matched or mismatched) selected from hematopoietic cells, tend the cells, heart, lung, kidney, liver or skin. The copolymer lor its related heteropolymer in combined the accordance of the copolymer in combined to the cells, and articles the copolymer in combined to the copolymer or its accordance of the copolymer in combined to the copolymer in copolymer in

binds promiscuously and with high affinity to various classes II MHC molecules of mouse and human origin, and can even displace antigens from the MHC antigen-binding groove. In this way, the presentation of other antigens and, consequently, the persistence of inflammatory process, are down regulated. In addition, Copolymer I is a potent inducer of regulatory T cells of the TAZ type. The present sequence represents a copolymer 1-related peptide which is used in the exemplification of the

This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one copolymer 1 or its related heteropolymer with at least one copolymer 1 or its related heteropolymer with at least one containing at least three different amino acids each selected from at containing at least three different amino acids each selected from at class three of the following groups: lysine and arginine; glutamic acid and aspartic acid; alanine, glycine and alanine; and tyrosine, tryptophan antimerabolite, antibody or immunosuppressive drug is an cantiporoliferative drug, inhibitor of lymphocyte activation, steroid, purine antimetabolite, antibody or immunomodulator. Accordingly, these immunosuppressive compositions can be used for treating or preventing graft rejection associated with transplantation of cells, tissue or cramated heteropolymer in combination which other immunosuppressive drugs in combination with other immunosuppressive drugs in the content immunosuppressive drugs in the content immunosuppressive froms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating or preventing graft rejection associated with transplantation of cells, tissue or organs comprises administering combination comprising copolymer 1 or its related heteropolymer with immunosuppressive drug for.
                                                                                                                                                                                                                                                                                                                                                                                                   Ordered copolymer peptide used to treat graft versus host disease Seg 23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         increases the effectiveness of the drugs at lower dosages, reducing side effects such that they are useful for host-versus-graft (HVG) response, as well as graft-versus-host disease (GVHD). This peptide sequence is an ordered copolymer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 47; DB 9; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiproliferative drug, inhibitor of lymphocyte activation, steroid, antiproliferative drug, inhibitor of lymphocyte activation, steroid, purine antimetabolite, antibody or immunomodulator. Accordingly, these immunosuppressive compositions can be used for treating or preventing graft rejection associated with transplantation of cells, tissue or organs (HLA-matched or mismatched) selected from hematopoietic cells, stem cells, heart, lung, kidney, liver or skin. The copolymer I or its related heteropolymer in combination with other immunosuppressive drugs increases the effectiveness of the drugs at lower dosages, reducing toxic side effects such that they are useful for host-versus-graft (HVG) response, as well as graft-versus-host disease (GVHD). This peptide sequence is an ordered copolymer of the invention.
                                                                                                                                                                                       ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one cooplymer or its related heteropolymer with at least one immunosuppressive drug. The present invention describes the copolymer as containing at least three different amino acids each selected from at least three of the following groups: lysine and arginine; glutamic acid and aspartic acid; alanine, glycine and alanine; and tyrosine, tryptophan and phenylalanine. In addition, the immunosuppressive drug is an addition, the immunosuppressive drug is an addition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating or preventing graft rejection associated with transplantation of cells, tissue or organs comprises administering combination comprising copolymer 1 or its related heteropolymer with immunosuppressive drug for.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ordered copolymer peptide used to treat graft versus host disease Seg 20.

This peptide represents a peptide derived from Cop 1 (Copolymer 1). This peptide was tested for binding to the peptide binding groove of HLA-DR. The method of the invention for treating a neurodegenerative disorder or disease in which there is accumulation of misfolded and/or aggregated proteins, excluding prion-related diseases, comprises administering to an individual an agent selected from Copolymer 1, a Copolymer 1-related polypeptide, and T cells activated with the invention also includes methods for: reducing disease them. The invention also includes methods for: reducing disease protection from glutamate toxicity in a patient suffering from a neurodegenerative disease or disorder selected from Huntington's disease, Alzheimer's disease or disease or disease or disease and parkinson's disease, Alzheimer's disease, Alzheimer's disease or Parkinson's disease. Specifically, treating a patient suffering from a neurodegenerative disease immunizing the patient with a vaccine comprises in membral disease progression or for protection from neurodegeneration in the patient. A pharmaceutical composition as administered in the method above, is useful for reducing disease procression, and/or for protection from neurodegeneration in the patient. A pharmaceutical composition as protection from glutamate toxicity in a patient suffering from the neurodegeneration in the method above, is useful for reducing disease procression, and/or for protection from neurodegeneration, and/or for protection from enurodegeneration, and/or in patient suffering from the neurodegeneration in the neurodegeneration, and/or in the method above, is useful for reducing disease procression, and/or for protection from enurodegeneration, and/or dor protection from enurodegeneration or disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alzheimer's disease or Parkinson's disease. The active agent is useful for manufacturing a medicament for treatment of neurodegenerative disorder or disease in which there is accumulation of misfolded and/or aggregated proteins, excluding prion-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating a neurodegenerative disorder or disease where there is accumulation of misfolded and/or aggregated proteins e.g. Parkinson's disease comprises using an agent e.g. Copolymer 1 or a Copolymer 1-related peptide.
                                                                                                                                                                                                                  Anticonvulsant; Nootropic; Neuroprotective; Antiparkinsonian; Cop 1; Copolymer 1; HLA-DR; neurodegenerative disease; glutamate toxicity; Huntingtons disease; Alzheimers disease; Parkinsons disease.

A;Title: Members of the MAZ family: A novel cDNA clone for MAZ from human pancreatic isl
A;Reference number: JC5076; WUID:96428591; PMID:8831693
                                                                                                                                                                                                A, Experimental source: pancreatic islet
C, Comment: This protein plays a role in the control of transcriptional initiation of gen
and between the introns of the mouse gene for immunoglobulin M-D.
C; Keywords: phosphoprotein; zinc finger
